John L. Gross, Ph.D., P.E.
Leader, Structures Group
United States Department of Commerce
National Institute of Standards and Technology
Gaithersburg, MD 20899-0001

Dear Dr. Gross:

Following are responses to your questions in your letter to Joe Englot dated April 5, 2004, which are repeated here in bold italics.

By this letter, I am requesting information from The Port Authority on fireproofing of the interior and exterior columns of the World Trade Center towers. Specifically, please provide the following:

1) ***Fireproofing material and thicknesses for the exterior columns as follows:***
- ***Plates 1 and 2 (these plates face the outside of the building and were covered by the aluminum column panels)***
- ***Plate 3 (interior plate within the occupied space)***
- ***Plate 4 (spandrel), both interior and exterior surfaces***

2) ***Fireproofing material and thicknesses for the core area box columns.***

3) ***Confirmation that the wide flange column sections were specified to be fireproofed as follows using Cafco Type DC/F:***
- ***Columns smaller than 14WF228 – 2-3/16 in***
- ***Columns greater than or equal to 14WF228 – 1-3/16 in.***

In response to your first three questions, Mr. Englot inquired throughout the Port Authority and was not able to find any information related to these questions other than that information already turned over to NIST.

4) ***Any information the Port Authority has regarding measurements of the in-place fireproofing material thickness.***

We have no records in our Materials Division of ever repairing or replacing fireproofing on exterior columns due to their inaccessibility and, therefore, have no recent thickness measurements of any re-applied fireproofing.

THE PORT AUTHORITY OF NY & NJ

We have no records in our Materials Division of ever repairing or replacing fireproofing on core columns due to their inaccessibility (other than columns which are accessible within the elevator shafts) and, therefore, have no recent thickness measurements of any re-applied fireproofing for core columns.

The only records of thickness measurements we could find were for the columns that are accessible within the elevator shafts. The Port Authority Materials Engineering Division took them and they correspond to World Trade Center Tower 1 elevator shafts. Discrete readings were taken at shaft 10/11 from the basement to the 45th Floor in Tower 1 in a report dated 4/7/1999. Mean thickness values were found for shaft 14/15 from the basement to the 80th Floor in Tower 1 in a report dated 8/4/1997. These measurements cover the full extent of these two elevator shafts. One was an express from the concourse lobby to 44 with a machine room on 47 and the other was express from the concourse to 78 with an EMR on 81. The readings for both of these shafts are attached (Excel file).

Discussions with Engineering Department staff and former World Trade Department staff indicate that these two shafts had asbestos abatement and were re-fireproofed. The measurements also show a "Minimum Thickness Required" of fireproofing. Staff members recall that there was a schedule of replacement fireproofing thickness that was prepared by the firm Leslie E. Robertson Associates (LERA). One staff member located a copy of one schedule, which will be forwarded under separate cover as a sample. We have contacted William Faschan of LERA and it appears that the "Minimum Thickness Required" is the thickness called for in a schedule that appeared in documents for the work that was prepared by LERA. The sample schedule indicates that the fireproofing applied was "Type Z-106". We will try to locate the specification book for this material. This information may be among the documents that LERA assembled for NIST at the Port Authority's 225 Park Avenue South office. We will continue to search for more complete sets of this information.

In the meantime, I hope this answers your questions. Please call or reply otherwise if you need further information.

Very truly yours,

Francis J. Lombardi, PE
Chief Engineer
